Potamogeton schweinfurthii e specie affini a foglia larga in Italia – *Potamogeton schweinfurthii* è segnalato per la prima volta nell’Italia peninsulare. Questa specie era stata recentemente riportata per la Sardegna e altre isole del Mediterraneo, dove era stata confusa con altre specie simili di *Potamogeton* a foglia larga, in particolare con *P. lucens*. Il ritrovamento di *P. schweinfurthii* in due località della Toscana (Italia centrale) ha suggerito di intraprendere un’indagine per verificare la presenza di ulteriori campioni di questa pianta tra il materiale di altre specie simili (*P. lucens*, *P. alpinus*, *P. nodosus*, *P. gramineus*) conservato nei principali erbari italiani. L’indagine erbariologica ha permesso di scoprire *P. schweinfurthii* anche nelle Marche e in Puglia. La distribuzione italiana di altre quattro specie simili del genere *Potamogeton* è precisata mediante lo studio dei reperti d’erbario.

Key words: distribution, herbarium data, identification key, Italy, new records, *Potamogeton schweinfurthii*.

Potamogeton schweinfurthii was recorded for the first time in Europe by Kaplan (2005a) who, investigating *Potamogetonaceae* collections in various European herbaria, discovered several specimens of *P. schweinfurthii* from the Mediterranean region. Collections from two sites in Sardinia represented the first reports for Italy, while the other collections came from Corsica, Malta, Crete and the Greek island of Kefallinía. The finding of *P. schweinfurthii* in Sardinia was successively reported in Conti et al. (2007).

Two other sites of this species were recently found in Tuscany (central Italy), which are the first records for the peninsular territory of Italy. The finding of the species in Tuscany has lead to carry out herbarium investigation to verify the possible presence of further specimens of this plant among the material of similar

species preserved in the main Italian herbaria.

The aim of this paper is to describe a detailed distribution of *Potamogeton schweinfurthii* in Italy based on field and herbarium data, to clarify the distribution of species with whose it has been or can be mistaken, and provide a key to identification of all these species.

Notes on the distribution and taxonomy of *Potamogeton schweinfurthii*

Potamogeton schweinfurthii was described for the first time on material from East Africa (Bennett, 1901). Its distribution in Africa was recently revised by means of herbarium investigations (Kaplan & Symoens, 2005). The species occurs in most of the African mainland, ex-

cept for the NW area, and in Madagascar and in the Azores. This species has been recently recorded by Kaplan (2005a) also from some islands of the Mediterranean Europe, including Sardinia. In this paper it is for the first time recorded from the peninsular Italy. Although the *P. schweinfurthii* collections from the Mediterranean islands and in the Italian peninsula are relatively recent, this species is unlikely to have only recently invaded this area. The more probable explanation of its recent discovery is that it is rather scarce in the Mediterranean region (as is usual at the borders of species' ranges) and has been overlooked by field botanists, partially also as a result of the rarity of the habitats suitable for this species (Kaplan, 2005a). Moreover, in the past, botanists devoted less attention to the flora and vegetation of wetlands, especially in Mediterranean areas (see Garbari, 1980; Tomei et al., 2001; Kaplan, 2005a). Their interest in aquatic plants increased in the second half of the 20th century, which provided more specimens that gave space for new discoveries.

The main reason why *P. schweinfurthii* was discovered only recently in Europe is that it can easily be mistaken with other species of *Potamogeton*, in particular with *P. lucens* L., with which it is closely related, but also with *P. gramineus* L., which all together belong to the *P. lucens* group *sensu* Wieglob (1988). In addition, *P. schweinfurthii* can be confused with *P. alpinus* Balb., and also with *P. x salicifolius* Wolfgang., a hybrid of *P. lucens* and *P. perfoliatus* L., recently recorded in Italy in the Como Lake (Kaplan, 2007). Finally, *P. schweinfurthii* was in Africa frequently confused with *P. nodosus* (Kaplan & Symoens, 2004; 2005). This later species occurs in Italy as well (Pignatti, 1982; Conti et al., 2005) and is therefore also considered in the present paper.

A further complication for the taxonomy of this group is enormous phenotypic plasticity of all *Potamogeton* taxa (Kaplan, 2002). In many cases, only complete and well-preserved specimens can be identified, and anatomical investigation of stem sections is necessary for determination of specimens (Wieglob, 1990; Symoens, 2006).

Materials and Methods

The present study intends to determine the distribution of *P. schweinfurthii* and of similar species *P. lucens*, *P. gramineus*, *P. alpinus* and *P. nodosus*, based on field investigation and data from Italian herbaria. The

examined material comes from the following herbaria abbreviated according to Holmgren & al. (1990): APP, BOZ, CAT, FI, FIAF, G-BU, MFU, MSNM, NAP, PAD, PAL, PAV, PERU, PESA, PI (PI-CAR, PI-PELL, PI-ARC), RO, ROV, SIENA, SS, TR, TSB, TO, UTV. In addition, the herbarium of the Botanical Garden of Florence and some personal herbaria (Herb. Selvi, Herb. Bartolucci) were consulted. Finally, herbarium records collected by Z. Kaplan in various European herbaria (BM, BP, BR, C, CAG, E, FR, G, H, K, L, LD, M, MSB, OLM, P, PR, PRA, PRC, UPS, WU) during previous studies were also included. The following features, which proved to be of diagnostic value in recent taxonomic revisions of this group (Preston, 1995; Wieglob & Kaplan, 1998; Kaplan, 2005a; Kaplan & Symoens, 2005; Symoens, 2006), were particularly investigated in the specimens: presence/absence of floating (emerged) leaves, length of the petiole of submerged leaves, length and width of lamina of the submerged leaves, number of the longitudinal veins in submerged leaves, length of stipules, length of peduncles, length of spikes and fruit size. These characters have been used to build up the determination keys and the descriptions of the species by integrating the information present in literature (Dandy, 1980; Pignatti, 1982; Clapham et al. 1987; Wieglob & Kaplan, 1998; Kaplan, 2005a; Symoens, 2006).

The localities given on the labels of the herbarium collections have been mapped to show the distribution of the studied species in Italy (Fig. 1-5). In the maps, empty circles refer to the specimens recorded before 1950, while full circles represent specimens recorded after 1950. The list of *specimina visa* is reported after the description of each species. The work by Cuccuini & Nepi (1999) was particularly useful for the identification of names of some collectors. The nomenclature follows Wieglob & Kaplan (1998).

Results and discussion

Potamogeton schweinfurthii A. Bennett in Dyer, Fl. Trop. Afr. 8: 220. 1901. ("Schweinfurthii").

DESCRIPTION - Rhizome slender, terete, perennial. Stem unbranched or sparingly branched, terete, annual. Submerged leaves sessile or with petioles 1-5 mm (some uppermost leaves rarely up to 19 mm) long, with lamina narrowly lanceolate to oblong-elliptical, (7-) 10-22 (-28)

mm wide, (55-) 86-167 (-250) mm long, yellow-green to bright green, often reddish towards the end of summer; longitudinal veins (5-) 7-9 (-11); floating leaves absent; stipules (10-) 22-40 (-44) mm long; fruiting spikes 25-60 mm long with peduncle (27-) 50-120 (-160) long, thicker than the stem; fruits 3-4 mm long; endodermis of U-type, interlacunar bundles present.

NOTES - As noted by Kaplan (2005a), this species was often confused with similar *Potamogeton* species; the present survey shows that the Italian specimens of *P. schweinfurthii* were confused with *P. lucens*. Both the herbarium specimens and the plants observed in the field possessed only submerged leaves. Kaplan (2005a) reports that in the Mediterranean region the presence of floating leaves is rare. In the Tuscan stations the species appears to be rather abundant, with stable populations fruiting every summer as observed since 2005.

DISTRIBUTION IN ITALY (Fig. 1)

Sardinia (see also Kaplan, 2005a), Tuscany (field survey), Marche and Apulia (herbarium survey), at a variable altitude between 0 and 330 m a.s.l.

The indicated localities supplement the known distribution of this species and represent the first records for peninsular Italy and continental Europe (Tuscany, Marche and Apulia regions). For Sardinia, the locality of Rio Cannas listed by Kaplan (2005a) is also mapped.

Potamogeton nodosus Poiret in Lamarck, Encycl. Méth. Bot., Suppl. 4: 535. 1816. ("nodosum").
(syn.: *P. fluitans* auct., non Roth).

DESCRIPTION - Rhizome slender, terete, perennial. Stem mostly unbranched, terete, annual. Submerged leaves petiolate, with lamina narrowly oblong to oblanceolate-oblong, (7-) 13-24 (-40) mm wide, (53-)

Fig. 1 - *Potamogeton schweinfurthii*: distribution in Italy according to the specimina visa (see the list in the text); empty circles = specimens recorded before 1950.

85-163 (-220) mm long, bright green to dark green, narrowly cuneate at base, acute at apex, with petiole (11-) 22-108 (-225) mm long; longitudinal veins (7-) 9-17 (-21); floating leaves mostly present in adult plants, lamina (13-) 20-37 (-75) mm wide, (40-) 63-115 (-155) mm long; stipules (15-) 32-67 (-105) mm long, petiole (18-) 50-150 (-240) mm long; fruiting spikes (20-) 28-50 (-72) mm long with peduncle 56-116 (-150) long, thicker than stem; fruits 3-4 mm long; endodermis of O-type or rarely U-O-type, interlacunar bundles absent.

Morphological note: Many examined specimens only presented floating leaves. This is because the submerged leaves of this species often disappear in adult plants, when floating leaves are developed. Phenotypes of *P. nodosus* that lack submerged leaves are difficult to identify according to characters usually given in determination keys. The floating leaves are mostly bigger than

those of any other here discussed species and exhibit specific tinge and opacity of the lamina and typical shape of the base of the lamina. These features mostly lead to successful identification. However, because these characters are difficult to describe in words, their correct application inevitably requires some experience.

Nomenclatural note - This species was frequently recorded under the name "*P. fluitans*" in the past (see e.g. Wieglob & Kaplan, 1998; Kaplan, 2001). However, this name is the correct name for the hybrid *P. lucens* × *P. natans* (Kaplan, 2005b).

DISTRIBUTION IN ITALY (Fig. 2)

Campania, Emilia-Romagna, Friuli-Venezia Giulia, Lazio, Liguria, Lombardy, Marche, Piedmont, Sardinia, Sicily, Tuscany, Trentino-Alto Adige, Umbria, Veneto.

Fig. 2 - *Potamogeton nodosus*: distribution in Italy according to the specimen visa (see the list in the text); empty circles = specimens recorded before 1950; full circles = specimens recorded after 1950.

ALTITUDE: 0-1500 m.

With respect to Conti et al. (2005), the presence of *P. nodosus* in the Umbria region is confirmed (see also Falcinelli & Donnini, 2009) and allows adding two new regions: Liguria and Sardinia. No one specimens were found to Abruzzo; according to Conti et al. (2007) the species has no longer been recorded in the Abruzzo region for a long time, and that is why it was not even reported in the check-list of the Abruzzo flora of Conti (1998).

Potamogeton alpinus Balbis, Mém. Acad. Sci. Turin, Sci. Phys. Math. 1, 10-11 (1802-1803): 329. 1804. ("alpinum").

(syn.: *P. rufescens* Schrad. ex Cham., Adnot. Fl. Berol. 5. 1815.).

DESCRIPTION - Rhizome slender, terete, perennial. Stem unbranched, terete, annual. Submerged leaves sessile, with lamina narrowly lanceolate to oblong-elliptical, (7-) 9-16 (-22) mm wide, (40-) 50-110 (-150) mm long, yellow-green to bright green, often reddish, obtuse or narrowly obtuse at apex; longitudinal veins 9-15; floating leaves present or absent, lamina 7-16 (-20) mm wide, (25-) 30-60 (-75) mm long; petiole (2-) 10-30 (-43) mm long; stipules (7-) 13-28 (-33) mm long; fruiting spikes (9-) 13-24 (-30) mm long with peduncle (15-) 27-80 (-125) long, as thick as the stem; fruits 2.5-3.5 mm long; endodermis of O-type, interlacunar bundles absent.

DISTRIBUTION IN ITALY (Fig. 3) - Friuli-Venezia Giulia, Lombardy, Piedmont, Trentino-Alto Adige, Aosta Valley, Veneto.

Fig. 3 - *Potamogeton alpinus*: distribution in Italy according to the specimen visa (see the list in the text); empty circles = specimens recorded before 1950; full circles = specimens recorded after 1950.

ALTITUDE 140 to 2300 m.

Pignatti (1982) reported that the presence of this species in Piedmont and Liguria needed of a verification. When compared to Conti et al. (2005), *P. alpinus* is recorded here also for Piedmont. No specimens were found from Liguria. The locality of quadrant nr. 9446 in Poldini (2002) is very probably sited in Austria and is reported by Hartl et al. (1992, Vidali, com pers.).

***Potamogeton gramineus* Linnaeus, Sp. Pl. 127. 1753**

DESCRIPTION - Rhizome slender, terete, perennial. Stem branched, terete, annual. Submerged leaves sessile, lamina linear-oblong or narrowly oblong to lanceolate, 2-6 (-10) mm wide, (15-) 24-51 (-100) mm long, bright green to dark green, mucronate at apex; longitudinal veins 5-7 (-9); floating leaves present or absent, petiolate, lamina 7-30 mm wide, 25-75 mm

long; petiole (2-) 12-59 (-85) mm long; stipules 7-24 (-29) mm long; fruiting spikes (13-) 15-35 (-48) mm long with peduncle 18-90 (-120) long, usually thicker than the stem; fruits 2.4-3.1 (-3.6) mm long; endodermis of U-type, interlacunar bundles present.

DISTRIBUTION IN ITALY (Fig. 4) - Lazio, Lombardy, Piedmont, Sicily, Trentino-Alto Adige, Aosta Valley, Abruzzo, Calabria and Friuli-Venezia-Giulia.

ALTITUDE: from 120 to 2000 m.

When compared to Conti et al. (2005; 2007), the species is recorded here also for Calabria. Conti et al. (2005) report the presence of *P. gramineus* also in Veneto and Tuscany. For Tuscany the indication for the Padule di Fucecchio, turned out to be erroneous because based on a badly determined specimen. The record for Veneto was successively corrected in Conti et al. (2007).

Fig. 4 - *Potamogeton gramineus*: distribution in Italy according to the specimina visa (see the list in the text); empty circles = specimens recorded before 1950; full circles = specimens recorded after 1950.

For Friuli-Venezia Giulia, the species appears in Polldini (2002) but it is included in a quadrant at the border with Austria in which the specimen, preserved in TSB, was effectively collected (Egger Alpen See); the presence of *P. gramineus* in this region is however confirmed by a specimen from Lago del Predil preserved in OLM.

Doubt remains on the presence of the species in Campania based on a old reference derived from an indication of Terracciano (1873), recently reported by Del Guacchio (2007).

The species is therefore considered by Conti et al. (2007) as no longer recorded in Campania. Field records under the name *P. gramineus* from Sardinia are reported by Desfayes (2008) but no Sardinian specimens of this species were found in the consulted herbaria; the occurrence in this region is therefore not indicated in our map based on revised material.

Potamogeton lucens Linnaeus, Sp. Pl. 126. 1753

DESCRIPTION - Rhizome slender, terete, biennial to perennial. Stem unbranched or branched, terete, slender to robust, annual. Fully developed submerged leaves with lamina oblong to broadly elliptical, (11-) 21-60 mm wide, (42-) 72-135 (-210) mm long, yellow-green to bright green, mucronate at apex, denticulate at margins; sometimes that the lowest leaves reduced to phylloides; petioles of leaves with unreduced lamina 1,5-12 mm long, with relatively constant length along the stem (rarely some leaves subsessile or petioles of leaves with reduced lamina sometimes up to 25 mm long); longitudinal veins 9-11; floating leaves always absent; stipules (16) 31-54 (-70) mm long; fruiting spikes (25-) 36-58 (-69) mm long with peduncle 40-280 long, conspicuously thicker than the stem; fruits 3.3-4.7 (-5.1) mm long; endodermis of U-type, interlacunar bundles present.

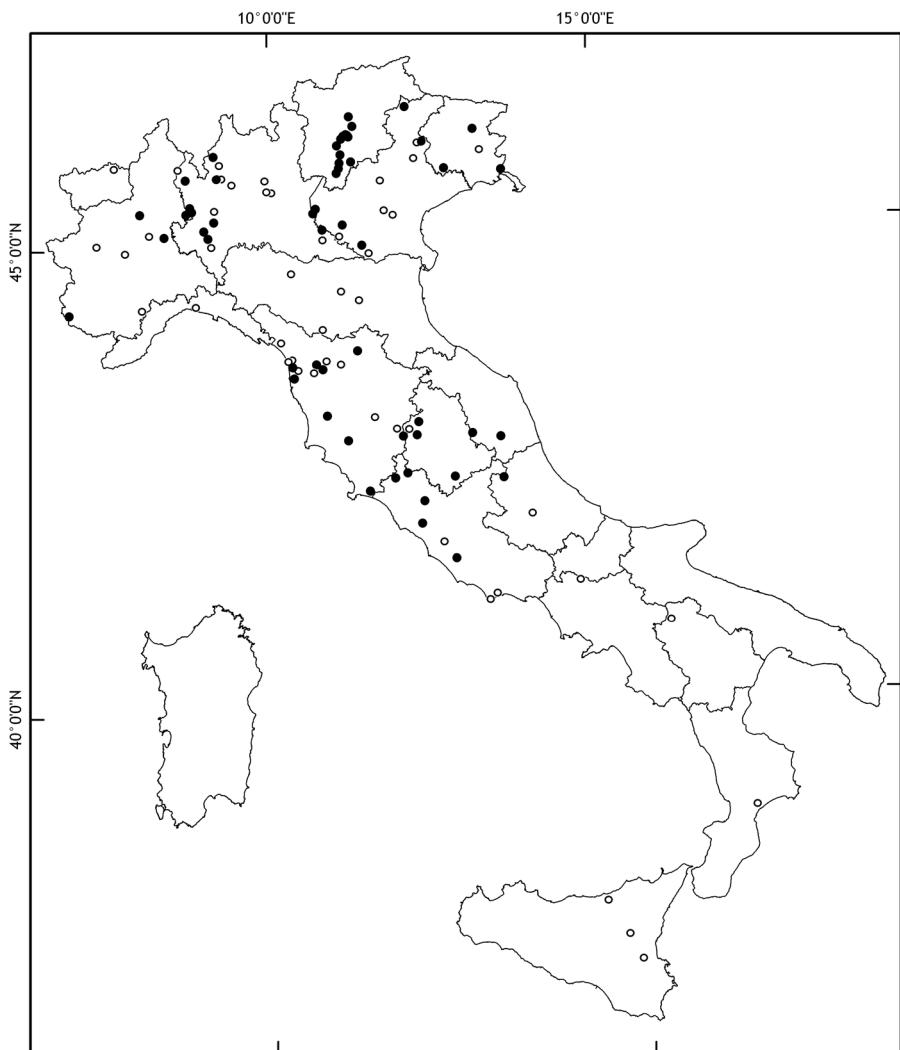

Fig. 5 - *Potamogeton lucens*: distribution in Italy according to the specimens visa (see the list in the text); empty circles = specimens recorded before 1950; full circles = specimens recorded after 1950.

DISTRIBUTION IN ITALY (Fig. 5) - Abruzzo, Basilicata, Calabria, Campania, Emilia-Romagna, Friuli-Venezia Giulia, Lazio, Liguria, Lombardy, Marche, Piedmont, Sicily, Tuscany, Trentino-Alto Adige, Umbria, Aosta Valley, Veneto.

ALTITUDE: 0-1930 m.

When compared to Conti et al. (2005), the present study identifies the occurrence of *P. lucens* also in Calabria. The specimen from Calabria is however very old (1898) and the actual presence of this species in this region should be verified by field surveys. Desfayes (2008) reported *P. lucens* from Sardinia but no sardinian collection of this species was found during our research. As already noted by Bocchieri & Poledrini (1983), some old records under the name of *P. lucens* are not documented by voucher herbarium specimens. The specimen determined as *P. lucens* from Taquisara (Ogliastro) preserved in FI belongs to *P. coloratus* and the specimens originally determined as such in CAG belong to *P. schweinfurthii* (see also Kaplan, 2005a) or to *P. polygonifolius* (rev. M. Desfayes, 17.5.2002).

Hybrids

Potamogeton x salicifolius Wolfgang. in Schult. et Schult. f., Mant. 3: 355. 1827, pro sp.

DESCRIPTION - It is a steril hybrid between *P. lucens* and *P. perfoliatus* and it is generally intermediate between its parents (Kaplan, 2007). It differs from *P. lucens* particularly in having the leaves sessile and semi-amplexicaul, and with more (9-17) longitudinal veins, and from *P. perfoliatus* by longer leaves with fewer veins and by bigger stipules.

DISTRIBUTION IN ITALY: Lombardy.

The finding of a specimen collected in PAV confirms the presence of this hybrid in Lombardy, where it has been recorded for the first time by Kaplan (2007) in Como Lake.

Key to *P. schweinfurthii* and similar species in Italy

1a. Submerged leaves sessile	2
1b. Submerged leaves petiolate (rarely subsessile), with petiole at least 1 mm long	4
2a. Submerged leaves obtuse at apex, with 9-15 longitudinal veins; stem unbranched; peduncle of fruiting spikes as thick as the stem apex	<i>P. alpinus</i>
2b. Submerged leaves acute to mucronate at apex, with (5-) 7-9 (-11) longitudinal veins; stem often branched; peduncle of the fruiting spikes usually thicker than the stem	3
3a. Submerged leaves 2-6 (-10) mm wide, (15-) 24-51 (-100) mm long; stipules 7-24 (-29) mm long; fruiting spikes (13-) 15-35 (-48) mm long	<i>P. gramineus</i>
3b. Submerged leaves (7-) 10-22 (-28) mm wide, (55-) 86-167 (-250) mm long; stipules (10-) 22-40 (-44) mm long; fruiting spikes 25-60 mm long	<i>P. schweinfurthii</i>
4a. Submerged leaves with lamina oblong to broadly elliptical, (11-) 21-60 mm mm wide, petioles 1,5-12 (-25 in some leaves with reduced lamina) mm long (rarely some leaves subsessile), with relatively constant length along the stem; floating leaves always absent	<i>P. lucens</i>
4b. Submerged leaves mostly narrowly oblong to oblong-elliptical, (7-) 10-24 (-40) mm wide, either the lower leaves sessile and upper shortly petiolate, with petioles 1-5 mm long (rarely up to 19 mm), or all leaves markedly petiolate with petioles (11-) 22-108 (-225), petiole length often variable along the stem; floating leaves present or absent	5
5a. Submerged leaves markedly petiolate, with petioles (11-) 22-108 (-225) mm long, lamina with (7-) 9-17 (-21) longitudinal veins; floating leaves usually present in adult plants; stem anatomy: endodermis of O-type, interlacunar bundles absent	<i>P. nodosus</i>
5b. Submerged leaves sessile or shortly petiolate, with petioles 1-5 mm long (rarely some uppermost leaves rarely up to 19 mm), lamina with (5-) 7-9 (-11) longitudinal veins; floating leaves mostly absent (unknown in Italian plants); stem anatomy: endodermis of U-type, interlacunar bundles present	<i>P. schweinfurthii</i>

- WIEGLEB G. & KAPLAN Z., 1998 - *An account of the species of Potamogeton L. (Potamogetonaceae)*. Folia Geobot. 33: 241-316.

Summary: *Potamogeton schweinfurthii* A. Benn is recorded for the first time from peninsular Italy. This species was recently recorded from Sardinia and other Mediterranean islands, where it was confused with some other similar broad-leaved species of *Potamogeton*, in particular with *P. lucens*. The finding of *P. schweinfurthii* in two Tuscan localities (C Italy) initiated an investigation to verify the presence of further specimens of this plant among the material of similar *Potamogeton* species (*P. lucens*, *P. alpinus*, *P. nodosus*, *P. gramineus*) preserved in the main Italian herbaria. The herbarium survey allowed discovery of *P. schweinfurthii* also in Marche and Apulia regions. The distribution in Italy of four other similar *Potamogeton* species is specified through the herbarium investigation.

APPENDIX 1: SPECIMINA VISA

Potamogeton schweinfurthii

Marche: Dintorni di Fano: acquitrini in sinistra dell'alveo del Metauro a 5 Km dalla foce, 15 m, 09/1980, *L. Poggiani* (PESA sub *P. lucens*); Dintorni di Fano: pozze in sinistra dell'alveo del Metauro presso la Madonna del Ponte, 5 m, 01/08/1986, *A. Brilli-Cattarini*, *L. Gubellini*, *L. Poggiani* (PESA sub *P. lucens* ?); Dintorni di Mondolfo: stagni sulla sponda sinistra del Cesano, 5 m, 04/06/1981, *A. Brilli-Cattarini*, *L. Gubellini*, *L. Poggiani* (PESA sub *P. lucens*). **Apulia:** Lago Alimini piccolo, loc. Fontanelle (Otranto, Lecce), 08/08/2008, *F. Bartolucci* (Herb. Bartolucci, sub *P. lucens*). **Sardinia:** Riu Picocca, Burcei, Cagliari, 200 m, 19/07/1980, *E. Bocchieri*, *A. Poledrini* (FI sub *P. lucens*); Sardaigne, Rio Cannas, 23/07/1958, *Stemmler* (G); Picocca-Fluß südl. Muravera, S-Sardinien, 02/09/1970, *W. Jürgen Schrenk* (FR, sub *P. zizii*); Sardinien; Picocca, 02/09/1970, *R. A. Höfer* (FR, sub *P. zizii*); “Rio Picocca”, Burcei, Cagliari, 24/06/1980, *E. Bocchieri et A. Poledrini* (CAG, sub *P. lucens*); ibidem, 19/07/1980, *E. Bocchieri et A. Poledrini* (CAG, sub *P. lucens*); ibidem, 200 m, 19/07/1980, (FI sub *P. lucens*); ibidem 05/06/1981, *E. Bocchieri et A. Poledrini* (CAG, sub *P. lucens*). **Tuscany:** Laghetto di San Fabiano (Monteroni d'Arbia), Siena, 15/09/2007, *P. Castagnini* (FI); ibidem, 12/08/2008, *F. Frignani*, *L. Lastrucci*, *B. Foggi*, *Z. Kaplan* (FI); Region of Tuscany: Province of Siena: water reservoir 1.1 km ENE of San Fabiano farm, 1.6 km NE of Monteroni d'Arbia, alt. 180 m, 12/08/2008, *Z. Kaplan*, *L. Lastrucci*, *F. Frignani* & *B. Foggi* 08/612 (PRA); Anghiari, lago artificiale in sponda destra del Te-

vere presso Viaio, 330 m, 20/07/2006, *L. Lastrucci*, *R. Benesperi* (FI); Anghiari, laghetti artificiali in sponda destra del Tevere presso loc. Viaio, 330 m, 12/08/2008, *L. Lastrucci*, *Z. Kaplan*, *B. Foggi*, *F. Frignani* (FI, SIENA); Tuscany (Italy), S. Fabiano/Monteroni d'Arbia (Siena), Die 29/09/2006, *Castagnini* (PRA); Tuscany (Italy), Anghiari (Arezzo), artificial lakes along Tevere River, 08/2006, *L. Lastrucci* (PRA); Region of Tuscany: Province of Arezzo: artificial lakes along Tevere (Tiber) River 3.5 km N of Anghiari: the lake 0.9 km NNW of Viaio; alt. 330 m, 12/08/2008, *Z. Kaplan*, *L. Lastrucci*, *F. Frignani* & *B. Foggi* 08/608 (PRA); Region of Tuscany: Province of Arezzo: artificial lakes along Tevere (Tiber) River 3.5 km N of Anghiari: the lake 0.7 km N-NNW of Viaio; alt. 330 m, 12/08/2008, *Z. Kaplan*, *L. Lastrucci*, *F. Frignani* & *B. Foggi* 08/611 (PRA).

Potamogeton nodosus

Campania: M. Alburno, lungo il fiume Tanagro, presso Polla, 10/06/1948, *A. De Philippis* (FI), Garigliano, s.d., *M. Tenore* (NAP); Fiume Garigliano presso il ponte (?), 23/06/1832, *G. Gusone* (NAP); Nel lago della Taverna delle Carraje presso Teano, 18/07/1834 *G. Gusone* (NAP); **Emilia-Romagna:** Codigoro, 3 m, 09/09/1991, *A. Brilli-Cattarini*, *S. di Massimo*, *L. Gubellini* (PESA); Fossi della pineta di Ravenna, 06/1864, *L. Caldesi* (TO et PI-CAR sub *P. natans*); Fontanetti lungo il fiume Secchia presso Rubiera, 05-06/1876, *E. Ferrari* (TO sub *P. natans*); Valli di S. Anna, lungo il Tanaro presso Modena, 11/07/1883, *A. Fiori* (FI sub *P. natans*); Parma, 06/1854, *G.*

Passerini (FI sub *P. natans*); Fossati nei dintorni di Modena, 07/1889, *A. Vaccari* (FI sub *P. natans*); Nelle fosse di S. Faustino in provincia di Modena, 21/06/1889, *A.
